

Re-mastered Goplan “ready” for Use!

Goplan is a group effort of Webbreakstuff, a company started in 2005 by a group of individuals to work and confer with, on website design, construction, development and deployment. With the aim to facilitate communication between project members, regardless of its scope, Webbreakstuff created its first public-faced software application, intended to work as an enhancement tool to assist in project management, and they called it Goplan!

Goplan, launched initially in the year 2005 underwent renewed development and up gradation to improve upon the pre-existing features, while incorporating novel ideas that will perform significant roles in the success of any project. You may look forward to a user-friendly dashboard, icalendar synchronization, microformats support, besides other features that you’re sure to relish! The revamped version was publicly launched on the 9th of September, 2006.

Close study reveals the increased usability of Goplan! The web-application can be used for multiple purposes. For instance, project managers and developers may use Goplan as a platform to keep track of all the work and technical activities that are a part of a web application development endeavor. Newspaper editors can use Goplan to manage and control submissions for their publication. Furthermore, this management application may be used by bloggers to manage blogs or information they find worth garnering and organizing. Thus, Goplan, as the title suggests is an instrument that helps you corroborate your ideas and thoughts, organize them and prepare a management plan that leads to flawless execution! So whether it’s scheduling your daily work, business activities, organizing a party or planning a wedding, Goplan is your helpmate, all the way through!

Goplan is currently accepting e-mails for sending out the first few application invites! This web-based application has not been cited in technical magazines for well thought out reasons. On the contrary to launching Goplan with a trumpet blast and all the fanfare, Webbreakstuff intends to invite people to use their application. These users may further send out invites to friends of theirs who’d have heard of the usability and accessibility of the application from people they trust. Thus, the growth would be gradual but steadfast, unlike the chaos that may be created if the alternative regular course is taken. Moreover, inviting feedback from current users can help quickly make up for any short comings or include any particulars that users may like to see as part of Goplan!

Along with inviting people to use Goplan for online collaboration and project management, Webbreakstuff has taken a step forward by starting a Goplan weblog. This blog informs readers about the features of Goplan such as its notes, calendar, tickets, tasks, files and chat rooms, the progress the web application is making and similar updates. Users post their comments to let us know how Goplan can be improved and that’s exactly what Webbreakstuff is trying to achieve.

An important point to note about Goplan is that it is not a Beta Software. Webbreakstuff declares that Goplan is “ready” and is not using the current plan of action due to fears of failure! Thus, Goplan has been launched and is not going to follow the trend of companies not launching their software products or web applications that create several problems while being used as “beta “software. The idea is to make Goplan successful, acting on the feedback, along the way!

The feedback Webbreakstuff has been receiving is motivating! The various features have been found to be well-integrated. It has been mentioned that it is fairly easy to create a new project, with the option of notes and a weblog available as effective tools for project managers. Goplan tickets are oriented towards customer support and the Goplan calendar,

supporting iCal subscription, shows events and dated tasks. Goplan chat may be used to create as many rooms within a project, as required. Also, the dashboard records all recent activity as well as RSS feeds. Users look forward to features that have been made known as future components of Goplan. They are sure to render this web-application much more interesting than its competitors!

Thus, starting out with 250 users in the first week was a learning process for Goplan! Any concerns encountered, were efficiently handled in a timely manner, while releasing necessary updates on a daily basis. Immediate attention and service left the users happy, to say the least! The cost of Goplan usage still remains to be decided. Webbreakstuff seems to be currently riding high on the encouraging positive feedback and accolades from Goplan users and would let that guide them in making several critical decisions. So, anyone who wants to be invited to use Goplan for their business or home planning may write to Goplan@Webbreakstuff.com. After all, the application has been designed with the very purpose of helping people manage their work better!

All in all, Goplan is a sophisticated online collaboration and project management tool, positioned to be a strong contender in the social project management space. The features that are still to be added will render Goplan the online management tool of choice, worldwide!
